**Carcinogenesis on the background of liver fibrosis: Implications for the management of hepatocellular cancer**

Joanne Marie O'Rourke, Vandana Mridhu Sagar, Tahir Shah, Shishir Shetty

### Abstract

Hepatocellular carcinoma (HCC) is now the second leading cause of cancer-related deaths globally and many patients have incurable disease. HCC predominantly occurs in the setting of liver cirrhosis and is a paradigm for inflammation-induced cancer. The causes of chronic liver disease promote the development of transformed or premalignant hepatocytes and predisposes to the development of HCC. For HCC to grow and progress it is now clear that it requires an immunosuppressive niche
