**COMMENTS TO AUTHORS**

Prandota and colleagues are reporting about an analysis of 178 patients admitted to the neurologyservice. Out of this cohort 19 patients were tested positive for TG infection. The manuscript needs major language revisions. TG infection and the neurological symptoms appear to be correlated. However, the authors did not rule out that TG infection and the neurological symptoms are just confounders! What what the consequence of the positive tests. Did it have impact on the treatment of these patients? What was the outcome? Otherwise this work is only of descriptive character and does not add any new information. The conclusion is just wrong. The results do not allow such a conclusion. There are way too many references, they should be reduced to 50%.
