Non-pharmacological intervention for posterior cortical atrophy

Agnès Weill-Chounlamountry, Jorge Alves, Pascale Pradat-Diehl

3 Abstract

Posterior cortical atrophy (PCA) is a rare neurodegenerative condition characterized by progressive visual-perceptual deficits. Although the neurocognitive profile of PCA is a growing and relatively well-established field, non-pharmacological care remains understudied and to be widely established in clinical practice. In the present work we review the available literature on non-pharmacological approaches for PCA such as cognitive rehabilitation including individual cognitive exercises and compensatory techniques.
