Suturing the Cornea A monofilament suture (nylon or polypropylene) works well in the cornea, because of its low tissue reactivity. Spatulated needles are preferred for maintenance of suture depth in partial-thickness lacerations. The most stable configuration of interrupted sutures is a planar loop, so the tissue contained within the suture

Feb 26, 2011 · In his first book, he recommended the indiscriminate use of cautery, but in his second book, the use of cutting instruments and sutures were implemented instead. In this book he described a technique called a "double suture" which is still used today. The technique of closing wounds by means of needle and thread is several thousand years old.
