COMMENTS TO AUTHORS

I read the paper, entitled "A rare case of intussusception in an adult with acute myeloid leukemia" by Law MF et al. My comments are as follow. 1. The authors reported an interesting case of intussusception in an adult with acute myeloid leukemia occurred during induction chemotherapy. It is important to notice clinical suspicion of this entity, while this complication is rare. However, it seems that images of computed tomography (CT) are not typical as intussusception. Can you show contrast enhanced CT including indication of leading point, ultrasonography images showing a target sign or sausage-shaped mass, intraoperative photograph showing intussusception, or gross findings of resected specimen? Additional objective findings of the other modalities to confirm the intussusception are needed to convince the confidence. 2. One of important points of this case report is intussusception occurrence in the patient with acute leukemia. The authors should discuss about pathogenesis resulting in intussusception in acute leukemia, including how the leading point was formed. 3. The authors should confirm the description of Reference #9.

COMMENTS TO AUTHORS

Abstract The grammar of the abstract needs to be improved. The authors have numerous fragmented sentences and places where they are missing words to make a complete thought out of the sentence. Overall, the abstract contains all the key elements needed.

Introduction The second sentence needs to be referenced.

Case What are anemic symptoms, is it abnormal lab work, dyspnea on exertion, chest pain, syncope etc. Needs to be further clarified. Was she admitted through the emergency department or a direct admission? Once again the grammar is not on par with a scientific publication. The first paragraph may not be needed. It seems out place unless the patient stayed in the hospital during their entire induction therapy, even if so, the first paragraph is not needed. Would re-write and start with the RLQ pain. The second paragraph does not need a differential, the reader should come with this on their own. Why was the CT completed without contrast? It would be nice to see the ring lesion.

Discussion Every statement made in the first paragraph needs to be referenced. Table 1 needs to be re worked. I did a brief literature search and found more cases of leukemia and intussusception. Once again, grammar needs to be addressed in paragraphs of the disuccsion.
