COMMENTS TO AUTHORS

it is a well written article, a case report about synchronous triple primary gastric adenocarcinoma, MALT lymphoma, and schwannoma. I have no remarks.

COMMENTS TO AUTHORS

This is a very interesting and noteworthy case with synchronous triple gastric tumor in one patient. However, there are some minor revisions for you. 1. To treat gastric MALToma with antibiotics only is restricted to MALToma of Lugan stage I, meaning the MALToma is limited to mucosa or submucosa layer. Do you have EUS evidence showing the MALToma was not involved beyond submucosa. Also, did you have bone marrow study or PET scan to prove there's no distant involvement of gastric lymphoma? Antibiotics treatment only is not adequate for lymphoma in this patient until the staging is confirmed as Lugan stage I. 2. After eradication of Helicobacter pylori, was there any confirmation test such as UBT? 3. Endoscopic follow-up with biopsy should be frequent and careful for patients with MALToma managed only with antibiotics instead of chemoradiotherapy. How often did this patient be followed up with endoscope? Inflammations on pathology may indicate the residual MALToma. What is the pathology after HP eradication? 4.

What is the stage of the gastric adenocarcinoma in this patient? Did the patient receive adjuvant chemotherapy? With the above information, this article would be more complete and more
