Posterolateral dislocation of the knee: Recognizing an uncommon entity

Colin YL Woon, Mark R Hutchinson

**Abstract**

Posterolateral dislocations of the knee are rare injuries. Early recognition and emergent open reduction is crucial. A 48-year-old Caucasian male presented with right knee pain and limb swelling 3 days after sustaining a twisting injury in the bathroom. Examination revealed the pathognomonic anteromedial "pucker" sign. Ankle-brachial indices were greater than 1.0 and symmetrical. **1** Radiographs showed a posterolateral dislocation of the right knee. He underwent emergency open reduction without an attempt at closed reduction. Attempts at closed reduction of **1** posterolateral dislocations of the knee are usually impossible because of incarceration of medial soft tissue in the
