## COMMENTS TO AUTHORS

The relation between Barrett's esophagus and adenocarcinoma was very important. So this study was very interesting, but there were some questions. First, biopsy is not always performed if the Barrett's esophagus is not changed in endoscopic examination. Did all patients always undergo biopsy when they had endoscopy for follow-up? If so, what the median follow-up span for this? Second, authors should add the table "patient characteristics". Third, were there any statistical differences in age groups?

## COMMENTS TO AUTHORS

Interesting and practical paper with several minor errors according to the spelling and grammar.
