Retrospective Study

Clinical profile and outcomes of pediatric endogenous endophthalmitis: A report of 11 cases from South India

Gayatri Murugan, Parag K Shah, Venkatapathy Narendran.

Abstract

AIM

To study the clinical profile and outcomes of pediatric endogenous endophthalmitis from a tertiary eye hospital in South India.

METHODS

A total of 13 eyes of 11 children presented to us with varied symptoms and presentations of endogenous endophthalmitis, over a five year period from January 2010 to December 2015 were studied. Except for two eyes of a patient, vitreous aspirates were cultured from all 11 eyes to isolate the causative organism. These eleven eyes also received intravitreal injections. All patients were treated with systemic antibiotics.

RESULTS

Two cases had bilateral endophthalmitis. Ages ranged from 4 days to 11 years. Five cases were undiagnosed and treated, before being referred to our center. 10 of the 13
