Perioperative thrombotic complications in liver transplantation

Paolo Feltracco, Stefania Barbieri, Umberto Cillo, Giacomo Zanusi, Marco Senzolo, Carlo Ori

Abstract

Although the perioperative bleeding complications and the major side effects of blood transfusion have always been the primary concern in liver transplantation (OLT), the possible cohesion of an underestimated intrinsic hypercoagulable state during and after the transplant procedure may pose a major threat to both patient and graft survival. Thromboembolism during OLT is characterized not only by a complex aetiology, but also by unpredictable onset and evolution of the disease. The initiation of a procoagulant
