## COMMENTS TO AUTHORS

The authors reported-term survival after gastrectomy and metastasectomy for gastric cancer with synchronous bone metastasis. This is very rare and interesting case. I have comment and question as bellow #1.The authors should present macroscopic resected stomach and metastatic tumor of the bone. #2.Were cancer cells detected in bone marrow and/or peripheral blood?

### COMMENTS TO AUTHORS

because this is a report of a single case, it is not easy to have a conclusion. i have no further comment for the authors.

## COMMENTS TO AUTHORS

I have reviewed this new case report: My major questions are: 1) The authors have not yet mentioned the potential risk of and the potential origins for "Gastric Remnant Cancer". 2) What was the patient's H. pylori status? 3) Was a fasting serum gastrin obtained? (e.g. did the authors consider origins for this poorly differentiated tumor?). 4) The description of the surgical procedure needs to be more complete if other investigators are to reproduce this finding (i.e. was an esophagojejunostomy produced). Minor issues are: 1) Page 2, Informed consent statement: patient not "patients". 2) Abstract, line 1: metastasis is a rare event; not "is rare event". 3) Discussion, line 17: "survival gain"; authors please define or elaborate on this gain. 4) In Discussion: please mention for the non-specialists that vimentin immunostaining is a test for Neurofilament immunoreactivity that has been identified in most neuroendocrine tumors.
