COMMENTS TO AUTHORS

In the present manuscript, Fry et al. meta-analyzed smoking/lung cancer relationships using parametric modeling according to the IESLC database. They found that the models describe the dose-relationships well and concluded that they can be used to more precisely estimate the lung cancer risk from smoking. Generally speaking, this study provides some interesting results and well written, and the limitation has been fully discussed in the discussion part. Considering all these, the manuscript is preferentially recommended to be published.

COMMENTS TO AUTHORS

In the present manuscript, Fry et al. meta-analyzed smoking/lung cancer relationships using parametric modeling according to the IESLC database. It is very interesting for further research smoking and lung cancer. The present revision had been carefully revised by the authors. There is only 1 advice about the title. "Positive dose-response relationship of lung cancer to amount smoked, duration and age starting"
