Strategies to optimize the use of marginal donors in liver transplantation

87

Daniele Pezzati, Davide Ghinolfi, Paolo De Simone, Emanuele Balzano, Franco Filipponi

Abstract

40

Liver transplantation (LT) is the treatment of choice for end stage liver disease (ESLD), but availability of liver grafts is still the main limitation to its wider use. Extended criteria donors (ECD) are considered not ideal for several reasons but their use has dramatically grown in the last decades in order to augment the donor liver pool. Due to improvement in surgical and medical strategies, results using grafts from these donors have become acceptable in terms of survival and complications; nevertheless a big debate still exists regarding their selection, discharge criteria and allocation policies. Many studies analyzed
