New trends in molecular and cellular biomarker discovery for colorectal cancer

Parisa Aghagolzadeh, Ramin Radpour

Abstract

Colorectal cancer (CRC) is the third leading cause of cancer death worldwide, which is consequence of multistep tumorigenesis of several genetic and epigenetic events. Since colorectal cancer is mostly asymptomatic until it progresses to advanced stages, the early detection using effective screening approaches, selection of appropriate therapeutic strategies and efficient follow-up programs are essential to reduce CRC mortalities. Biomarker discovery for colorectal cancer based on the personalized genotype and clinical information could facilitate the classification of patients with certain types and stages of cancer to tailor preventive
