COMMENTS TO AUTHORS

This is a noteworthy review on mycosis fungoides. The discussion on newer cytokines is well written and valuable. Clinical features, general histopathology and general treatment could be condensed and directed mainly to modern concepts and fundamentals of treatment based on the cytokines current knowledge.

COMMENTS TO AUTHORS

In general, it is a good and well written manuscript and I only have a few comments. I consider that the manuscript could be described succinctly in some sections. The focus is chemokines and their receptors, these could be the major section of the manuscript. Highlight of the principal treatment could be useful.

COMMENTS TO AUTHORS

Very interesting and well written review of mycosis fungoides. The discussion regarding the newer cytokines is also well written. Since the primary audience for the article is likely to be dermatologists, you can reduce the content regarding clinical features, general histopathology and general treatment, focusing instead mainly on the updates related to cytokines involved in the pathogenesis and how these can be applied to the treatment. Looking at the title the discussion regarding the newer chemokines could have been clubbed with the pathogenesis—and this should have been followed by and correlated with the principles of treatment and newer treatment options.
