Retrospective Study

Reliability of the pronator quadratus fat pad sign to predict the severity of distal radius fractures

Julia Loesaus, Isabel Wobbe, Erik Stahlberg, Joerg Barkhausen, Jan Peter Goltz

Abstract

Aim: To evaluate the reliability of pronator quadratus fat pad sign to detect distal radius fracture and to predict its severity.

Methods: Retrospectively we identified 89 consecutive patients (41 female, mean age 49 +/-18y) who had X-ray (CR) and computed tomography (CT) within 24h following distal forearm trauma. Thickness of pronator quadratus fat pad complex
