

Dear Editor,

We have revised our manuscript accordingly.

And answered all critics step by step.

Sincerely,

Öner Özdemir, MD

In the manuscript "Solid Organ Transplantations and COVID-19 disease" by Yılmaz Emine Aylin and Özdemir Ö, the authors highlight the risk factors involving SOT recipients and COVID-19. The manuscript is well written, nevertheless a few points should be addressed:

Major points:

- This is a mini review, but the manuscript should increase the reports with SOT patients and COVID-19.
- We have increased the reports, as suggested. The reference number increased from 25 to 40.
- There is a conflict in the literature regarding if SOT are in greater death risk or not than non-SOT patients. This should be explored (references).
- A new subsection titled to 'Other Risk Factors for COVID-19 Development and Mortality in Transplantation Patients' is added into the manuscript.
- Impact of other co-infections (viral and bacterial) on SOT COVID-19 patients.
- Another new subsection titled to 'Impact of co-infections (fungal) with COVID-19 in Transplantation Patients' is added into the manuscript.

Minor points:

- The authors report a few drugs used for immunosuppression, but there are other drugs commonly used, and also reports of anti-coronaviruses properties on those drugs.
- Under the subsection of 'various therapeutic options...' and 'vaccination...', there are several paragraphs are added into the text.
