Endoscopic ultrasound elastography for solid pancreatic lesions

Tanyaporn Chantarojanasiri, Pradermchai Kongkam

Abstract

Elastography is one of technologies assisting diagnosis of solid pancreatic lesions (SPL). This technology has been previously used for measuring the stiffness of various organs based on a principle of "harder the lesions, higher chance for malignancy". Two elastography techniques; strain and shear wave elastography, are available. For endoscopic ultrasound (EUS), only the former is existing. To interpret results of EUS elastography for SPL, 3 methods are used; 1) pattern recognition, 2)

2015年12月21日 - Endoscopic ultrasound elastography (EUS-LE) is a non-invasive technique for the diagnosis of pancreatic lesions. It is based on the principle of shear wave elastography (SWE) and has been widely used in the diagnosis of pancreatic lesions. The aim of this review is to provide an overview of the current status and future prospects of EUS-LE in the diagnosis of pancreatic lesions.
