## **SPECIFIC COMMENTS TO AUTHORS**

This is a meaningful and informative article, with important findings. It mapped the effects of COVID-19 pandemic on mental health and learning concerns of high-schoolers in China. The article is very well written, with very feel aspects to review, listed below.

- substitute "In total, 893 students were participated" by "In total, 893 students have participated"; - substitute "866 out of 683students" by "683 out of 866 students"; - In the following extract, I did not understand how most of them have returned to their normal routine and, at the same time, it seems that most of them are not going to school: "93.0% reported that they have returned to their normal routine (Table 2). 68.3% student considers this outbreak has negatively affected their studies. Although 96.5% of the respondents are willing to returning back to schools"; - Please, be more precise in these parts of your text "health of high school students in a cohort in China", since your data is from one single school; - Add to the "limitations" the information that your data is from one single school in China and may not represent other schools and regions in China; - It seems that this is the authors' opinion ("but they are prepared to take precaution measures") and, as such, should be indentified as "in our opinion"; - Some results are mentioned in the "Discussion", I suggest to keep them in the "Results"; - Many of the described results in "Results" are not clear, unless the tables are seen. Meanwhile, many of the tables are not clear. Therefore, I suggest eliminating most of the tables (especially: 3,4,5,6 and 7) and describing the results including more details and the quantitative analysis; - The meaning of classes 1, 2 and 3 are not clear; - In table 1 there is an inversion of urban and rural numbers.
