

Reviewer 1

Fibromatosis-like metaplastic carcinoma is classified as a rare type of metaplastic carcinoma of the breast. It is often misdiagnosed as benign stromal proliferative lesions or benign mesenchymal tumors of the breast because of its mild morphology. In this study, the authors reported the clinical data of two cases of fibromatosis-like metaplastic carcinoma of the breast and performed pathomorphological observation and immunohistochemical staining of the surgically resected specimens. The cases are very interesting, and the manuscript is well written. The reviewer recommends to accept this manuscript after a minor editing.

Reply: Thank you for your affirmation and suggestions. We have checked and edited the manuscript according to the journal guideline.

Reviewer 2

This is a very interesting case report of two cases of fibromatosis-like metaplastic carcinoma of the breast. The authors described the cases in detail, and discussed them well. No specific comments to the authors.
