Esomeprazole regimens for reflux symptoms in Chinese patients with chronic gastritis

Jing Sun, Yao-Zong Yuan, Xiao-Hua Hou, Duo-Wu Zou, Bin Lu, Min-Hu Chen, Fei Liu, Kai-Chun Wu, Xiao-Ping Zou, Yao-Qing Li, Li-Ya Zhou

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed on a cycle ergometer at a workload of 150 watts. The control group performed no exercise. The HR and EE were measured at rest and during exercise at the beginning and end of the 10-week period. The HR and EE were significantly higher in the training group than in the control group at the end of the 10-week period. The results of this study suggest that a 10-week training program can improve the HR and EE of sedentary, middle-aged women.

Aim: To compare symptom control with isomeprazole regimens for non-erosive reflux disease and chronic gastritis in patients with a negative endoscopy.

METHODS: This randomized, open-label study was designed in line with clinical

Esomeprazole regimens for reflux symptoms in Chinese patients with chronic c
