Hepatocellular carcinoma: A comprehensive review

Lisa P Waller, Vrushak Deshpande, Nikolaos Pyrsopoulos

Abstract

15 Hepatocellular carcinoma (HCC) is rapidly becoming one of the most prevalent cancers worldwide. With a rising rate, it is becoming a prominent source of mortality. Patients that have ongoing liver disease demonstrate the greatest risk to acquire HCC. Individuals with chronic Hepatitis B and C infections are most commonly afflicted. Different therapeutic options including liver resection, transplantation, systemic and local therapy must be tailored to each patient. Liver transplantation offers leading results to achieve a cure. The Milan criteria are acknowledged as the model to classify the individuals that meet requirements to undergo transplantation. Mean survival remains suboptimal because of long waiting times and limited donor organ resources. Recent debates involve expansion of these criteria to create options for patients with HCC to increase overall survival.

KEYWORDS: Hepatocellular carcinoma, liver transplantation, hepatectomy, Milan Criteria, Sorafenib, Living donor liver transplantation, transarterial chemoembolization,
