COMMENTS TO AUTHORS

The manuscript "Individualized Obesity Research: -Status quo and Future Outlooks" reviewed the recently update of the study on obesity, especially the researches on bariatric surgery, gut hormone, and obesity related cancer. It is an attractive topic, the evidence collected is quite inclusive and the discussion in each section is in great detail. As the title emphasized "individualized research", there is not too much evidence to support the "individualized". It seems that the content can't support the title, or the title is not that proper, which need to be reconsidered to make it consistent. As for the writing, there are a lot grammar errors and confusing sentences which need to be carefully checked.

COMMENTS TO AUTHORS

We have carefully evaluated this new manuscript. Since this manuscript is designed for the field of translational research, the authors must focus attention on four major points in this manuscript: 1) The only efficient treatment demonstrating results in excess weight loss and reduction of obesity-associated diseases results from bariatric surgery. 2) There is evidence that preoperative multidisciplinary preparation and education may lead to better long-term results after bariatric surgery. 3) There is an association between morbid obesity and different types of cancer. In addition, obese patients have a tendency for worse outcomes after cancer treatment. 4) The inflammatory effect of adipose fat tissue might be a general precursor of carcinogenesis. Our minor comments include: In the first page of the introduction: 2,1 billion worldwide needs to be changed to 2.1 billion worldwide. In the paragraph regarding the NKT cells, the last sentences should be "The role of NKTs in obesity still remains unclear".
