COMMENTS TO AUTHORS

This article is mentioned about selective biliary cannulation techniques for the difficult biliary cannulation cases. The authors especially compared early needle-knife fistulotomy (NKF) with double-guidewire technique (DGT), and concluded that early NFK achieved a higher success rate of cannulation with a lower incidence of PEP. We often experience difficult cannulation cases. And we try DGT or some precut techniques. I think that this paper is very important clinically and interesting for many endoscopists, who perform ERCP. However there are a few problems to be modified.
