Tests and procedures used to diagnose liver hemangiomas include: 1. Ultrasound,an imaging method that uses high-frequency sound waves to produce images of the liver 2. **Computerized tomography (CT) scanning**,which **combines** a **series of X-ray images taken** from different angles around your body and uses computer processing to create cross-sectional images (slices) of the liver 3. **Magnetic resonance**

Hemangioma of the Liver

Medical Condition

A non-cancerous tumor of the liver madeup of tangled blood vessels

A noncancerous liver mass composed of tangled blood vessels. This causes abdominal pain, nausea and vomiting.

- Very rare (Fewer than 20,000 cases per year in US)
- Not known to be contagious
- No vaccine available
- Requires lab test or imaging
- Treatable by a medical professional
- Can last several days or weeks

The causes are not clear. It is thought to be a congenital abnormality. The symptoms include pain in the abdomen, appetite loss, nausea and vomiting. In most cases liver hemangioma is not treated. This is because in most people it does not grow or is not large enough to be removed surgically. Treatment depends on location and size of the hemangioma. Treatment includes surgical removal of the tumor, artery ligation, liver transplant and radiotherapy.
