COMMENTS TO AUTHORS

This is an interesting study about transjugular intrahepatic portosystemic shunt for severe jaundice in patients with acute Budd–Chiari syndrome. In this study, the feasibility of of treating severe jaundice secondary to acute Budd–Chiari syndrome with transjugular intrahepatic portosystemic shunt. About 37 patients with severe jaundice secondery to acute Budd–Chiari syndrome were treated. 16 patients without hepatic venules obstructionPercutaneous underwent angioplasty of IVC and/or HVs. And 21 patients with occluded hepatic venules underwent TIPS. The authors concluded that Severe jaundice due to acute Budd–Chiari syndrome can be relieved by TIPS when hepatic venules were occluded, leading to a satisfactory clinical outcome. Severe jaundice with bilirubin above 3mg/dL is NOT the contraindication of TIPS for patients with acute Budd–Chiari Syndrome. On the contrary, transjugular intrahepatic portosystemic shunt is an appropriate option for severe jaundice due to Budd–Chiari Syndrome. Comments: 1 The manuscript need to be edited. Some minor language polishing should be corrected. A native English speaker should make a proof of the manuscript. 2 The abstract should be added into the text. 3 The discussion need to be re-write with more ref. 4 Reference list is missing. Please check it.
