Conclusion: Minor revision

Specific Comments to Authors: The report by Silvia Cocca, et al. described a complication after trans-arterial chemoembolization (TACE), post-TACE hepatic necrosis and biliary stenosis. This complication is relatively rare, and it is very important for clinicians to consider how it is early diagnosed and treated. The present report is an interesting case. However, several issues requested to be addressed. 1. Please provided detailed clinicopathological information and following-up information. Thank you for your suggestions. We added more clinical and histopathological details in the manuscript. About follow-up, that is still ongoing, we added more information in detail.
n. 2. Figures. All figures are too rough and please describe them in figure legends. Also, All figures need to be cited in the content. Thank you for your suggestions. We added the figures citation in the text and added a follow-up radiological image. Moreover all the figures have legends. 3. Please unify abbreviations, ex. HCC represents hepatocarcinoma or hepatocellular carcinoma. Thank you for your suggestions. We unified the abbreviations thank you.
