Host cellular MicroRNA involvement in the control of HBV gene expression and replication

Yoshiaki Mizuguchi, Toshihiro Takizawa, Eiji Uchida

Abstract

A large number of studies have demonstrated that the synergistic collaboration of a number of microRNAs, their growth factors and their downstream agents is required for the initiation and completion of pathogenesis in the liver. MicroRNAs are thought to exert a profound effect on almost every aspect of liver biology and pathology. Accumulating evidence indicates that several miRNAs are involved in the HBV life cycle and infectivity, in addition to
