COMMENTS TO AUTHORS

What is the anti-HBcAb result? De novo malignancy is well known after solid organ transplant and it has little new knowledge adding to the current literature.

COMMENTS TO AUTHORS

This manuscript is a case report of one patient who developed de-novo HCC following a pediatric living related donor liver transplantation. The authors described that this is the first report of de-novo HCC after a pediatric living related donor liver transplantation without the presence of hepatitis B or C. The report is well documented and written. Otherwise, no new information was presented. Figure 1 may be deleted. Most of the last paragraph of the discussion should be deleted, since it is repetition of previous information.
