Standardization in laboratory medicine - Adoption of common reference intervals to the Croatian population

Zlata Flegar-Meštrić, Sonja Perković, Andrea Radeljak

Abstract

Considering the fact that the results of laboratory tests provide useful information about the state of health of patients, determination of reference value is considered an intrinsic part in the development of laboratory medicine. There are still huge differences in the analytical methods used as well as in the associated reference intervals which could consequently significantly affect the proper assessment of patient health. In a constant effort
