**COMMENTS TO AUTHORS**

1) Hyperlipidemia is very common after liver transplantation(LT) and can be observed in up to 71% of cases. Occurrence of lipid disorders is multifactors such as immunosuppressive agents, increased body weight, malnutrition, abnormal renal function, impaired glucose metabolism and genetic predisposition after liver transplantation. The post-LT recipients have an approximately 64% increased risk of cardiovascular events in comparison with the general population because of hyperlipidemia. The review is very important guidance to clinical docotors who can well treat and prevent the hyperlipidemia and reduce risk factors such cardiovascular complications after liver transplantation. 2) The introduction including atherogenesis, its metabolic impact and diagnostics in hyperlipidemia should be further cut down . Tha main introduction and discussion concisely emphasize on treatment and provention of hyperlipidemia after liver transplantation.

### COMMENTS TO AUTHORS

The authors suggested an approach of managing lipid abnormalities occurring after liver transplantation. This topic is very important and timely in the current days when liver transplantation is widely being performed. The manuscript is well-written and will be a good guidance to dealing with hyperlipidemia in LT patients.
