COMMENTS TO AUTHORS

Major comments: ? In retrospect, if the condition had been considered, would the CT images have been diagnostic or would there still have been doubt? The authors claim that it is difficult to make a correct diagnosis without knowledge of the disease (stated in the abstract and final paragraph of the discussion). However even if known, could it have been diagnosed pre-operatively? ? The authors claim that laparoscopic resection is the treatment of choice, presumably over open surgery, because of the minimal invasive nature of the procedure. However the patient was discharged 7 days post op which seems rather long for a laparoscopic colonic resection. ? Based on one this one case report, I think that the recommendation of laparoscopic rather than open resection seems a bit strong. ? Core tip: this is a repetition of the abstract and should be shortened. ? Case report: The narrative is rather misleading. The first sentence suggest that the patient had a colonoscopy then other tests including another colonoscopy. Minor comments: ? Figure 1: An arrow is needed in B to show the intussusception. ? Figure 1: There seem to be two other duplicate images that are not labeled. ? Figure 2: an arrow should show the mass

COMMENTS TO AUTHORS

Dear Editor, Thank you very much for your kind invitation to review this interesting manuscript. ??'s a well written manuscript about adult colon duplication causing intussusception. -In discussion part the authors should add the list and related references of of other submucosal cystic lesions and neoplasms of gastrointestinal system which may cause difficulty in the clinical, endoscopic, and macroscopic differential diagnosis.
