COMMENTS TO AUTHORS

This manuscript well reviewed optimal hemodynamic characteristics during liver transplantation. Moreover, the authors advocated their flowchart for performing graft inflow modulation. Conclusion should be more concise.

COMMENTS TO AUTHORS

Dear Authors, Hepatic hemodynamic changes during liver transplantation: A review is a good study. Cases' presentation is enough. There are some repetitions in this review. Although this topic was reviewed by many studies, this review will be interesting for WJG readers. Sincerely yours.

COMMENTS TO AUTHORS

The issue addressed in this paper is very interesting, hemodynamics being of utmost importance in liver transplantation. The paper was structured as a review of the literature with 2 case presentations. Major issues: - the paper is not about all the hemodynamic changes in liver transplantation, that is arterial, portal and venous (with all its corresponding parameters, such as resistance index, velocity, etc). The paper addresses only the issue of portal hemodynamic changes (hypo- and hyperperfusion) and this should be clearly stated in the title, otherwise it could be misleading. - I would consider this paper more as a case presentation with a thorough discussion than a review of the literature. Minor issues: - I think the paragraphs under the subtitle "Physiology of liver hemodynamics" could be eliminated as they present common knowledge. Other comments: - Good English - Well organized body text I consider that the subject of this paper is very interesting and not well covered in the literature
