

Reviewer #1:

**Scientific Quality:** Grade B (Very good)

**Language Quality:** Grade B (Minor language polishing)

**Conclusion:** Accept (General priority)

**Specific Comments to Authors:** This is a progress review in the topic of psychological interventions. Breast cancer has become the leading cancer worldwide. The authors have provided a decent review on the topic. It is worth confirming that almost all the articles analyzed by the authors are within the last five years. However, the reference 28 is not found in the main text, it is recommended to verify it. The authors provided multiple types of intervention measures for postoperative breast cancer. These contents are comprehensive, but more insightful discussions should be added to improve the quality of this review.

Reviewer #2:

**Scientific Quality:** Grade C (Good)

**Language Quality:** Grade B (Minor language polishing)

**Conclusion:** Minor revision

**Specific Comments to Authors:** Wang J et al. Conducted a literature review analysis on psychological intervention in breast cancer patients after radical mastectomy. It has been proven that psychological intervention has a significant therapeutic effect on postoperative psychological disorders, improving patients' negative emotions, enhancing their psychological resilience, and effectively enhancing their quality of life and treatment compliance. The authors analyzed a lot of literature, and made relevant descriptions and analyses on breast cancer, negative emotions, psychological intervention, etc. As a review article, this paper would be helpful for researchers to understand current trends of psychological intervention of postoperative psychological disorders. Overall, I did find the manuscript is informative and worthy for the publication in this journal. I suggest supplementing the relevant research on the negative emotions significantly influence the incidence of BC in the article before publication.

Dear reviewers and editors

Thanks for you valueable comments. It really helpful.

(1) I added reference 28 in the text

(2) I provided insightful discussions at the beginning of every sections and The discussion section has been rewritten.

(3) I added three references and relevant content of research on the negative emotions significantly influence the incidence of BC in the second section (NEGATIVE EMOTIONS AND BREAST CANCER) of the text.

(4) The manuscript has been re-edited for language and a new proof of language polishing has been provided
