COMMENTS TO AUTHORS

Very interesting study, after some minor language revision, it can be published.

COMMENTS TO AUTHORS

In this study, the authors assessed the using of dezocine combined with propofol for the anesthetization of patients undergoing indolent colonoscopy for the assessment of gastrointestinal function. The study collected patients' general information and anesthesia data, including their overall medical experience and pain management. This clinical study of dezocine combined with propofol indicates that it is a successful method for the anesthetization of indolent colonoscopy patients without pain, and should therefore be widely used. Overall, this study is well designed, and the manuscript is well written. However, some minor revisions are required before final publication. 1 The text need to be edited, some blanks are missing. Also, some spelling mistakes should be corrected. A native English speaker needed. 2 Tables are informative, but the data need to be check again. 3 Figure is interesting. However, if some more figures are provided, it will be more better. 4 References are updated, and well discussed.
