COMMENTS TO AUTHORS

This is an interesting case report given a likely rare set of circumstances that led to this complication. However I do not believe that based upon this one complication that likely resulted from improper clip application, use of absorbable endo-clips or ultrasonic dissection can be recommended which may result in a high frequency of complications. The paper does need spelling and language corrections- such as "completion rate" in the introduction paragraph.

COMMENTS TO AUTHORS

1. In the Abstract, line 3, "While the exact pathogenesis still unknown" should be changed to "While the exact pathogenesis IS still unknown". 2. The authors mentioned that choledochoduodenal fistula could be potentially avoided by the use of absorbable endo-clips or ultrasonic dissection without clipping, do you think it is suitable to manage the cystic duct stump besides the vessels? Do you think intra-corporeal suture ligation of cystic duct before dissection is another solution? 3. Please provide an intra-operative image of the lesion and adjacent tissue.

COMMENTS TO AUTHORS

This case report is interesting because its own rarity. Something more is requested, in discussion, about the pathophysiology concerning the involvement of duodenum in developing the choledochoduodenal fistula following the position of endo-clip as well as a discussion on other therapeutic options.
