SPECIFIC COMMENTS TO AUTHORS

This paper describes a typical case of multicentric reticulohistiocytosis (MRH) in a Chinese man. The manuscript is well-structured and adequately covers relevant literature on MRH. The topic is not novel but is nevertheless educational. Incomplete follow-up and open-ended case outcomes is the main limitation of the case. I have two suggestions. 1. I suggest the author summarize the characteristics of MRH in a table, with comparison to common differential diagnosis, e.g. RA, PsA, DM. This would make it easier for clinicians to understand and apply the knowledge in daily clinical practice. 2. Please elaborate more on MRH in Asian people - what are the characteristics of MRH in this specific population, in contrast to European patients?
