Endoscopic diagnosis of sessile serrated adenoma/polyp with and without dysplasia/carcinoma

Murakami T *et al.* Endoscopic diagnosis of serrated lesion

Takashi Murakami, Naoto Sakamoto, Akihito Nagahara

### Abstract:

Sessile serrated adenoma/polyps (SSA/Ps) are early precursor lesions in the serrated neoplasia pathway, which results in colorectal carcinomas with *BRAF* mutations, methylation for DNA repair genes, a CpG island methylator phenotype, and high levels of microsatellite instability. Some of these lesions can rapidly become dysplastic or invasive carcinomas that exhibit high lymphatic invasion and lymph node metastasis potentials.

2014年2月26日 - BACKGROUND AND STUDY AIMS: Sessile serrated adenomas/polyps (SSA/Ps) are precursors of colorectal cancer (CRC), but their endoscopic detection can be difficult. We therefore examined the endoscopic characteristics of SSA/Ps with and without dysplasia in a cross-sectional study. PATIENTS AND ...
