COMMENTS TO AUTHORS

The manuscript "Sublingual Immunotherapy (SLIT) for pediatric allergic rhinitis: the clinical evidence" by Poddighe and colleagues summarizes current RCT studies for pediatric SLIT treatment. Overall, this manuscript is well written and suitable as a review. Some minor issues might be considered previous to publication 1) Abstract, 3rd sentence: SCIT is also able to cure allergic respiratory diseases. 2) SLIT for allergic rhinitis, 3rd sentence: SCIT is currently in many European countries preferred for pediatric treatment since only few approved SLIT drugs are available for children (i.e. UK, Germany) 3) Also for SLIT in grass pollen allergy, some issues need consideration: (i) each drug needs own evidence-based data to show effect, (ii) studies vary from 6 months-36 months, (iii) head-to head studies for SLIT vs SLIT and SLIT vs SCIT are missing. 4) The authors should consider different compliance to SLIT (treatment at home) vs SCIT (injection at MD site). How might affect this study results in real life? 5) Based on the available data: which SLIT drug has the best evidence?

COMMENTS TO AUTHORS

Re: REVIEW. Sublingual immunotherapy (slit) for pediatric allergic rhinitis: the clinical evidence. Sent for consideration for publication in WORLD JOURNAL OF CLINICAL PEDIATRICS This is an interesting review on sublingual immunotherapy (SLIT), but in order to enhance its strength, the authors should discuss also: 1. The influence of smoke and tobacco fumes on SLIT in pediatric individuals. 2. How advisable it is to prescribe the SLIT for the management of grass allergic rhinitis in children 3. The short course of high-dose SLIT, in allergic children. (Asia Pac Allergy 2015; 5:163)
