**Liver fibrosis and hepatic stellate cells: Etiology, pathological hallmarks, and therapeutic targets**

Chong-Yang Zhang, Wei-Gang Yuan, Pei He, Jia-Hui Lei, Chun-Xu Wang

### Abstract

Liver fibrosis is a reversible wound-healing process aimed at maintaining organ integrity, and presents as the critical pre-stage of liver cirrhosis, which will eventually progress to hepatocellular carcinoma (HCC) in the absence of liver transplantation. Fibrosis generally results from chronic hepatic injury
