Is there a role for systemic targeted therapy after surgical treatment for metastases of renal cell carcinoma?

Adrian Husillos Alonso, Manuel Carbonero Garcia, Carmen González Enguita

Abstract

Metastatic renal cell carcinoma (mRCC) is a challenging disease. Despite the new targeted therapies, complete remissions occur only in 1-3% of the cases, and the most effective first-line treatment drugs have reached a ceiling in OS (ranging from 9 to 49 months). Metastasectomy remains to be the only curative option in most patients with mRCC. Prognostic have been recently published,
