COMMENTS TO AUTHORS

A Bibliometric Analysis on Top 100 Cited Articles in Nonalcoholic Fatty Liver Disease Research The present study is very interesting on a high prevalent chronic liver disease. There are some errors on the abbreviations along the text The table 6 is not important The discussion is too long at the present form and redundant (8 pages?). I suggest to rewrite this section

COMMENTS TO AUTHORS

This study retrieved the 100 top-cited articles in the field of non-alcoholic fatty liver disease and determines the country of origin, peak of highly-cited articles and international collaborations. Major Points The list is of interest, but the authors have analysed the topics covered using frequency of keywords. It would be more useful to determine the topics of the articles by reading them and then discuss the themes and findings. The discussion is long and often does not relate directly to the articles that the authors have selected in their top 100. They resort to topics that may or may not be important (the discussion of herbal therapies is a case in point) and refer to recent reviews in secondary journals rather than the primary and important articles that they have identified. The English usage is not always easily understandable and grammar needs review.
