New biomarkers for clinical management of hepatitis C virus infected patients

Alessandra Biasiolo, Andrea Martini, Patrizia Pontisso

19

Abstract

Hepatocellular carcinoma (HCC) is the third most frequent oncological cause of death worldwide, principally a consequence of hepatitis C virus infection and its prognosis is mostly poor. For early identification and surveillance of hepatitis C virus (HCV) patients with liver disease progression, the availability of suitable diagnostic and prognostic biomarkers is still an unmet clinical need. Alfa-fetoprotein together with imaging techniques is commonly used, however its specificity and sensitivity are not satisfactory.
