Manuscript Type: CASE REPORT

Parallel transjugular intrahepatic portosystemic shunt with Viatorr® stents for transjugular intrahepatic portosystemic shunt insufficiency: A case report and review of literature

Raissi D *et al.* Parallel TIPS with Viatorr® stents

Driss Raissi, Qian Yu, Nisiewicz Michael, Steven Krohmer

Abstract

BACKGROUND

Transjugular intrahepatic portosystemic shunt (TIPS) can alleviates complications of portal hypertension such as ascites and variceal bleeding by decreasing the portosystemic gradient. In limited clinical situations, parallel TIPS may be only solution to alleviate either variceal bleeding or ascites secondary to portal hypertension when the primary TIPS fails to do so. Data specifically addressing the use of this partially polytetrafluoroethylene covered nitinol stent (Viatorr®) is largely lacking despite Viatorr® being the current gold standard for modern TIPS shunt placement.

CASE SUMMARY

All three patients had portal hypertension and already had a primary Viatorr® TIPS
