Functional neuroanatomy in panic disorder: Status quo of the research

Thomas Sobanski, Gerd Wagner

Abstract

Panic disorder (PD) is a frequent psychiatric disease. Gorman *et al* (1989; 2000) proposed a comprehensive neuroanatomical model of PD, *which suggested* that fear- and anxiety-related responses are mediated by a so-called "fear network" *which is centered in the amygdala and includes the hippocampus, thalamus, hypothalamus,*
