SPECIFIC COMMENTS TO AUTHORS

The authors did a survey in young Chinese students on awareness and information status on breast cancer. The study has potential. Still, even though there was a language editing the used service was not qualified to help in scientific papers. This needs to be redone by a really qualified service with native English speaking people. Apart from language, the study provides interesting data. What must be fixed for content: 1. Authors did mention incredibly high incidence rates of breast cancer for young women – this should be checked and more references need to be included to verify that – but I guess the numbers are too high. 2. Authors need to include more content on hereditary breast cancer – they need to try to evaluate the survey for differences in the studied population with family history of breast cancer and such without that family history. This should lead to more relevant results. 3. For sure rate of breast cancer did not change in human population during last years. Only detection rates may have been changed – parts of the paper, which seem to refer to increased rates of breast cancer must be changed accordingly. For the questions to answer by the reviewer 1 Title. Should read as Knowledge, attitude, practice and influential factors of college students with regards to breast cancer 2 Abstract. Abstract is not written in clear English and needs to be rewritten – results are not understandable yet 3 Key words. Can be improved 4 Background. Focus is too much on China and hereditary percentage of BC is not clearly given and outlined for its meaning 5 Methods. yes – but my statistics expertise is not that high. 6 Results. Research is worth studying and led to interesting results 7 Discussion. Must be better structured and needs language adjustment to better understand 8 Illustrations and tables. ok 9 Biostatistics. Unable to evaluate 10

Units. yes 11 References. Must be included more international papers – yet too many Chinese and pure Chona oriented papers are included. 12 Quality of manuscript organization and presentation. Must be improved 13 Research methods and reporting. Unable to evaluate 14 Ethics statements. Seems to be ok

SPECIFIC COMMENTS TO AUTHORS

Did the researcher take into account whether the participants in the questionnaire are urban or from the countryside because this will affect their information even if they are university students

SPECIFIC COMMENTS TO AUTHORS

Thanks to the authors for revisions, which made paper better understandable. Still there are some points to be checked: - acc. to <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2894028/> the rate of young women with breast cancer is ~7% ; this number should be used and not the 5-13% of Ref 12. - it must be at least mentioned introduction that early onset of breast cancer can be a hint on a familar case of breast cancer - it must be discussed that familial cases of breast cancer change the KAP values in women from affected families compared to unaffected ones and that this was not considered in the present study.
