Insulin receptors in the kidneys in health and disease

Singh S *et al.* Insulin receptors in the kidneys

Sarojini Singh, Rajni Sharma, Manju Kumari, Swasti Tiwari

Abstract

Insulin is an important hormone that affects various metabolic processes, including kidney function. Impairment in insulin's action leads to insulin resistance in the target tissue. Besides defects in post-receptor insulin signaling, impairment at the receptor

Insulin signalling to the kidney in health and disease. ... Initially insulin was considered only important for rapid control of blood glucose by its action on a restricted number of tissues; however, it has now become clear that this hormone controls an array of cellular processes in many different tissues.

2015年10月7日 - Insulin resistance refers to reduced sensitivity of organs to insulin-initiated biologic processes that result in metabolic defects. Insulin resistance is common in patients with end-stage renal disease but also occurs in patients with chronic kidney disease (CKD), even when the serum creatinine is minimally increased.
