COMMENTS TO AUTHORS

I have some suggestions are list as below: 1. page 2, what does cART stand for? 2. In my opinion, such as breast cancer, nasopharyngeal carcinoma, ovary cancer, leukemia are all popular cancers worldwide. Is there any significance of these cancer in HIV-positive subjects? 3. A summary table reviewed the all cited references is needed.

COMMENTS TO AUTHORS

Journal: World Journal of Virology Manuscript No.: 15496 Title: Non-AIDS defining malignancies among HIV-positive subjects: the epidemiology and outcome after two decades of HAART era Authors: P. Brugnaro, E. Morelli, F. Cattelan, A. Petrucci, E. Raise, S. Panese, A. Barelli, F. Esemé and F. Cavinato Investigators now distinguish between cancers such as lymphoma and Kaposi's sarcoma that correlate highly in patients with AIDS, and cancers such as lung cancer where the extent of correlation is less. The two are called "AIDS defining" and "Non-AIDS defining" cancers, respectively. The authors here focus on the non-AIDS defining cancers (NADCs) and review clinical studies that address their degree of correlation with co-existing AIDS and especially the effects of HAART therapy on cancer progression and on the physician's ability to treat the cancer. Specific cancers treated in the review include lung, colorectal, hepatocellular and anal cancer plus Hodgkin's lymphoma and cutaneous malignancies. The review is timely, authoritative and full of useful references. It also contains useful specific suggestions regarding how physicians can cope with AIDS therapy in patients also requiring therapy for cancer. Other comments: 1. Abstract: The abstract
