Dear editor,

Please find attached files of revised manuscript in word format

Effect of Mirena Placement on Reproductive Hormone Levels at Different Time Intervals after Artificial Abortion

Author: Xiaoxiao Jin, Lin Sun, Xiaoli Lai, Jie Li, Meili Liang, Xia Ma

Name of Journal: World Journal of Clinical Cases

Manuscript NO: 70646

First of all, thank you for your careful guidance of this article. Revision has been made according to the suggestions of the reviewer:

Reviewer: 06074575

I read this manuscript with great interest, and found this manuscript is very well written. Placement of an intrauterine device, such as the Mirena, after an artificial abortion can improve the disturbance of menstrual disorders on the

basis of effective contraception, and can prevent uterine adhesions. The most effective time for intrauterine device placement after artificial abortion is still uncertain, and the analysis of sex hormones and adverse reactions after intrauterine device placement is insufficient. In this point of view, this study is very interesting, and the results are significance for clinicians. Minor comments:

1. A minor language polishing should be revised.
2. The results are well discussed. However, the limit of the study should be discussed also.
3. The tables are good, but require an editing.

Thank you for your advice.

After receiving the comments, We read the article in detail, polished the language, discussed the results and the limitations of the article again, and revised the table.

Thank you again for publishing our manuscript in the World Journal of Clinical Cases.

Sincerely Yours,

Xia Ma
