Abstract

Per-oral pancreatotomy (POPS) describes endoscopic procedure to visualize the main pancreatic duct. POPS specifically has the advantage of direct visualization of the pancreatic duct, allowing tissue acquisition and also directed therapies such as stones lithotripsy. The aim of this review is to analyze and summarize the literature around pancreatotomy. Pancreatotomy consists in the classic technique of the "mother-baby" method in which a mini-endoscope is passed through the accessory channel of the therapeutic duodenoscope. Pancreatotomy has two primary indications for diagnostic purpose. First, it is used for visualization and histological diagnosis of IPMNs. POPS in
